"Alice wants to discuss about Deep Learning with Bob"

"Alice wants to discuss about Deep Learning with Bob"

Issues with using ANN/CNN on sequential data

- In feedforward and convolutional neural networks, the size of the input was always fixed.
 - In many applications with sequence data, the input is not of a fixed size.

Input 1: "Its an average movie"

Input 2: "The direction was pathetic but the cinematography was fantastic"

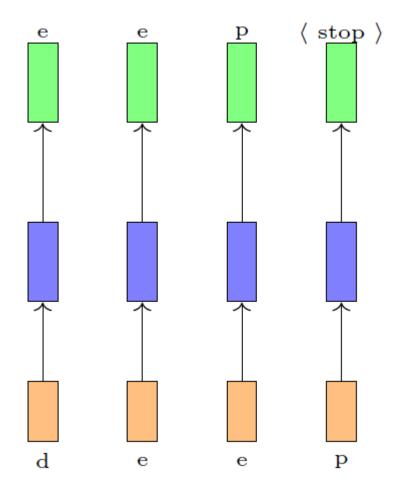

Issues with using ANN/CNN on sequential data

- In feedforward and convolutional neural networks, the size of the input was always fixed.
 - In many applications with sequence data, the input is not of a fixed size.

- Further, each input to the ANN/CNN network was independent of the previous or future inputs.
 - With sequence data, successive inputs may not be independent of each other.

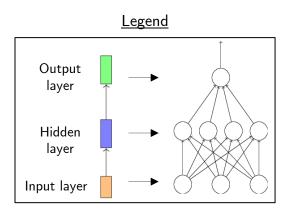

Modelling Sequence Learning Problems: Introduction

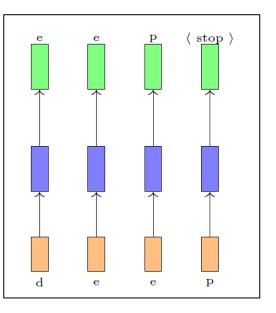

Task: Auto-complete

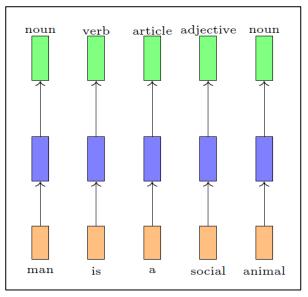

- Successive inputs are no longer dependent
- The length of the inputs and the no. of predictions you need to make is not fixed

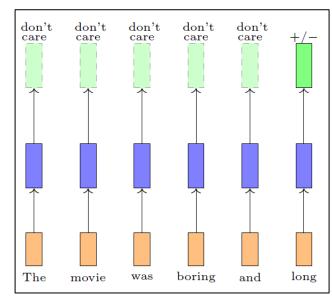

Each network is performing the same task

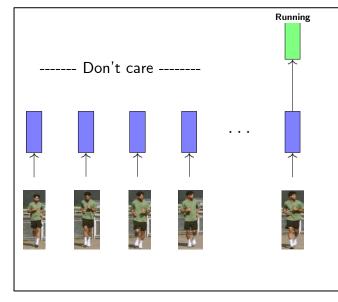

Modelling Sequence Learning Problems: Examples

Task: Auto-complete

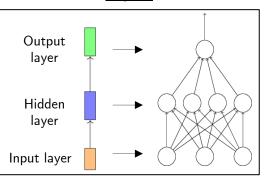

Task: P-o-S tagging

Task: Movie Review

- The model needs to look at a sequence of inputs and produce an output (or outputs).
- For this purpose, lets consider each input to be corresponding to one time step.
- Next, build a network for each time step/input, where each network performs the same task (eg: Auto complete: input=character, output=character)

Task: Action Recognition

Legend

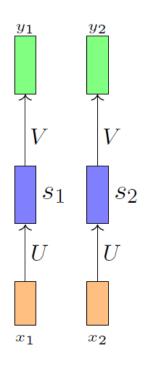

Source: CS7015 Deep Learning, Dept. of CSE, IIT Madras

How to Model Sequence Learning Problems?

- 1. Model the dependence between inputs.
 - Eg: The next word after an 'adjective' is most probably a 'noun'.
- 2. Account for variable number of inputs.
 - A sentence can have arbitrary no. of words.
 - A video can have arbitrary no. of frames.
- 3. Make sure that the function executed at each time step is the same.
 - Because at each time step we are doing the same task.

Modelling Sequence Learning Problems using Recurrent Neural Networks (RNN)

<u>Introduction</u>

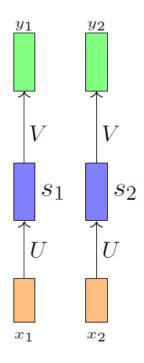

Source: CS7015 Deep Learning, Dept. of CSE, IIT Madras

Considering the network at each time step to be a fully connected network, the general equation for the network at each time step is:

$$s_i = \sigma(Ux_i + b)$$
$$y_i = \mathcal{O}(Vs_i + c)$$
$$i = \text{timestep}$$

Modelling Sequence Learning Problems using Recurrent Neural Networks (RNN)

<u>Introduction</u>

Source: CS7015 Deep Learning, Dept. of CSE, IIT Madras

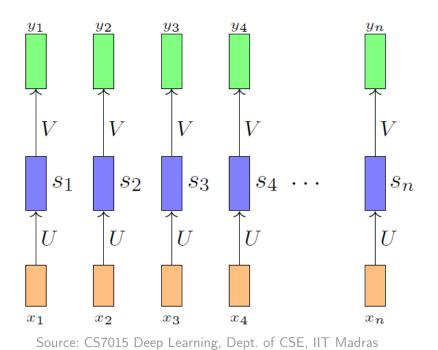

Considering the network at each time step to be a fully connected network, the general equation for the network at each time step is:

$$s_i = \sigma(Ux_i + b)$$
$$y_i = \mathcal{O}(Vs_i + c)$$
$$i = \text{timestep}$$

Since we want the same function to be executed at each timestep we should share the same network (i.e., same parameters at each timestep)

Recurrent Neural Networks (RNN): Introduction

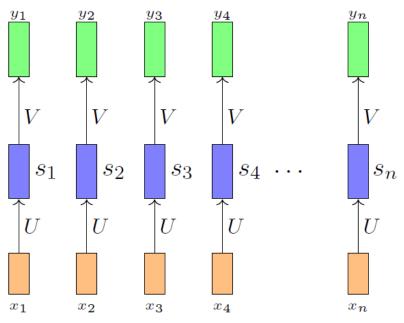

• If the input sequence is of length 'n', we would create 'n' networks for each input, as seen previously.

By doing so, we have addressed the issue of variable input size!!

Recurrent Neural Networks (RNN): Introduction

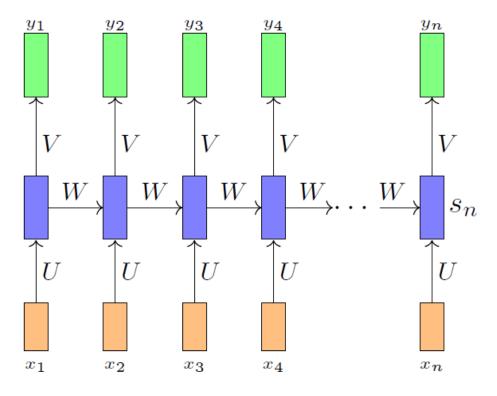

• If the input sequence is of length 'n', we would create 'n' networks for each input, as seen previously.

Source: CS7015 Deep Learning, Dept. of CSE, IIT Madras

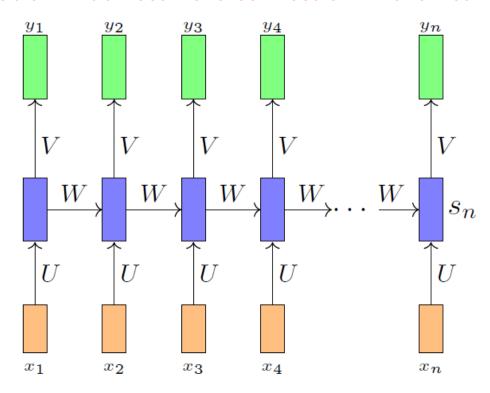

But, how to model the dependencies between the inputs?

Solution: Add recurrent connection in the network.

Source: CS7015 Deep Learning, Dept. of CSE, IIT Madras

Solution: Add recurrent connection in the network.

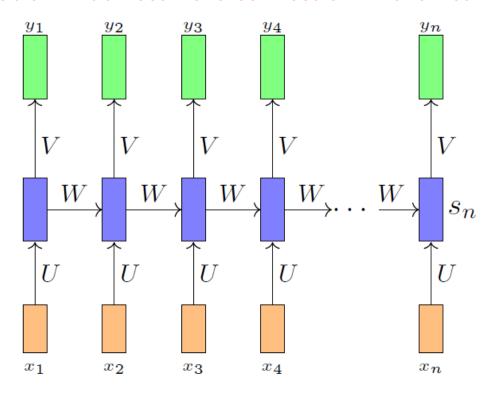

Source: CS7015 Deep Learning, Dept. of CSE, IIT Madras

• So, the RNN equation:

$$s_i = \sigma(Ux_i + Ws_{i-1} + b)$$
$$y_i = \mathcal{O}(Vs_i + c)$$

Solution: Add recurrent connection in the network.

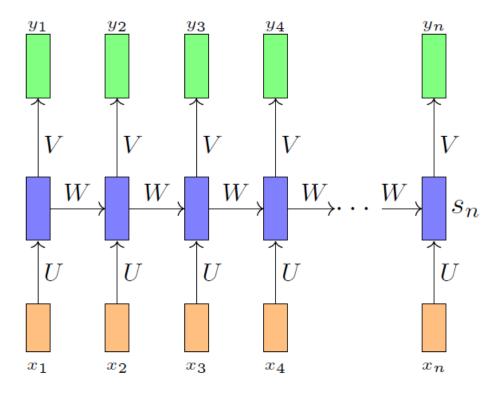

Source: CS7015 Deep Learning, Dept. of CSE, IIT Madras

• So, the RNN equation:

$$s_i = \sigma(Ux_i + Ws_{i-1} + b)$$
$$y_i = \mathcal{O}(Vs_i + c)$$

U, W, V, b, c are parameters of the network

Solution: Add recurrent connection in the network.

Source: CS7015 Deep Learning, Dept. of CSE, IIT Madras

• So, the RNN equation:

$$s_i = \sigma(Ux_i + Ws_{i-1} + b)$$
$$y_i = \mathcal{O}(Vs_i + c)$$

U, W, V, b, c are parameters of the network

The dimensions of each term is as follows:

 X_i -- [1 x no. of i/p neurons]

 s_i -- [1 x no. of neurons in the hidden state]

W -- [no. of neurons in the hidden state x no. of neurons in the hidden state]

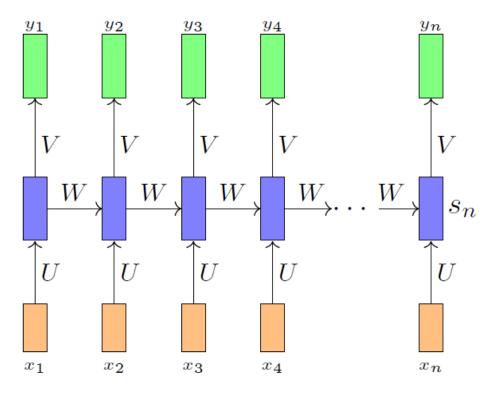

U -- [no. of i/p neurons x no. of neurons in the hidden state]

V -- [no. of neurons in the hidden state x no. of neurons in the o/p state]

 $b - [1 \times \text{no. of neurons in the hidden state}]$

 $c - [1 \times \text{no. of neurons in the o/p state}]$

Solution: Add recurrent connection in the network.

Source: CS7015 Deep Learning, Dept. of CSE, IIT Madras

• So, the RNN equation:

$$s_i = \sigma(Ux_i + Ws_{i-1} + b)$$
$$y_i = \mathcal{O}(Vs_i + c)$$

U, W, V, b, c are parameters of the network

The dimensions of each term is as follows:

 X_i -- [1 x no. of i/p neurons]

 s_i -- [1 x no. of neurons in the hidden state]

W -- [no. of neurons in the hidden state x no. of neurons in the hidden state]

U -- [no. of i/p neurons x no. of neurons in the hidden state]

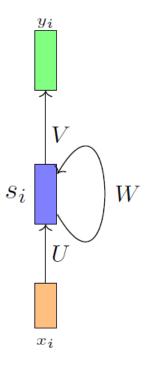

V -- [no. of neurons in the hidden state \times no. of neurons in the o/p state]

 $b - [1 \times \text{no. of neurons in the hidden state}]$

 $c - [1 \times \text{no. of neurons in the o/p state}]$

- At time step i=0 there are no previous inputs, so they are typically assumed to be all zeros.
- Since, the output of s_i at time step i is a function of all the inputs from previous time steps, we could say it has a form of **memory**.
- A part of a neural network that preserves some state across time steps is called a memory cell (or simply a cell)

Compact representation of a RNN:

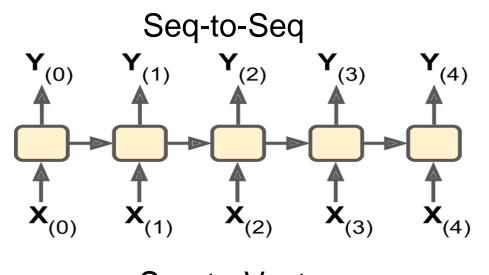

Source: CS7015 Deep Learning, Dept. of CSE, IIT Madras

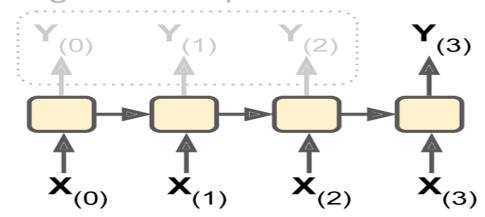

- Unrolling the network through time = representing network against time axis.
- At each time step t (also called a frame) RNN receives inputs x_i as well as output from previous step y_{i-1}

Input and Output Sequences

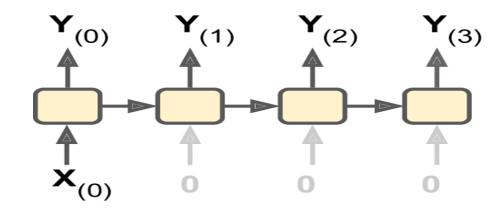

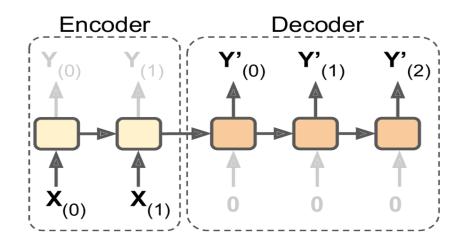

Seq-to-Vector

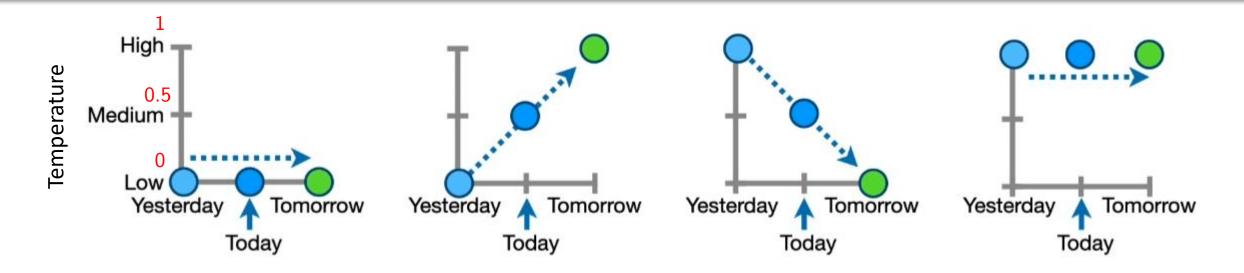

Ignored outputs

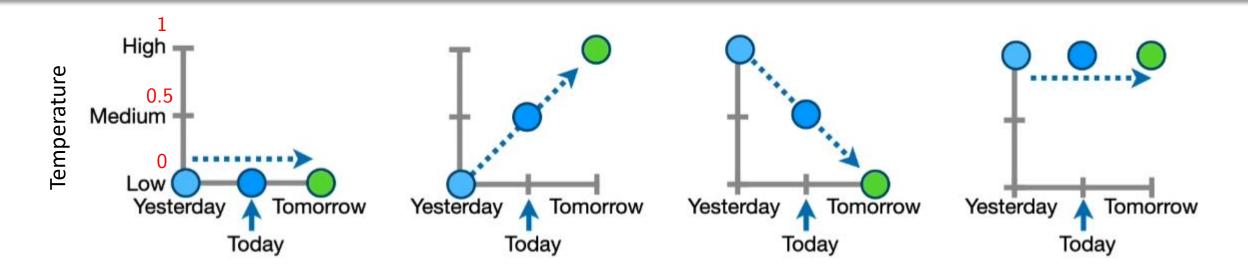

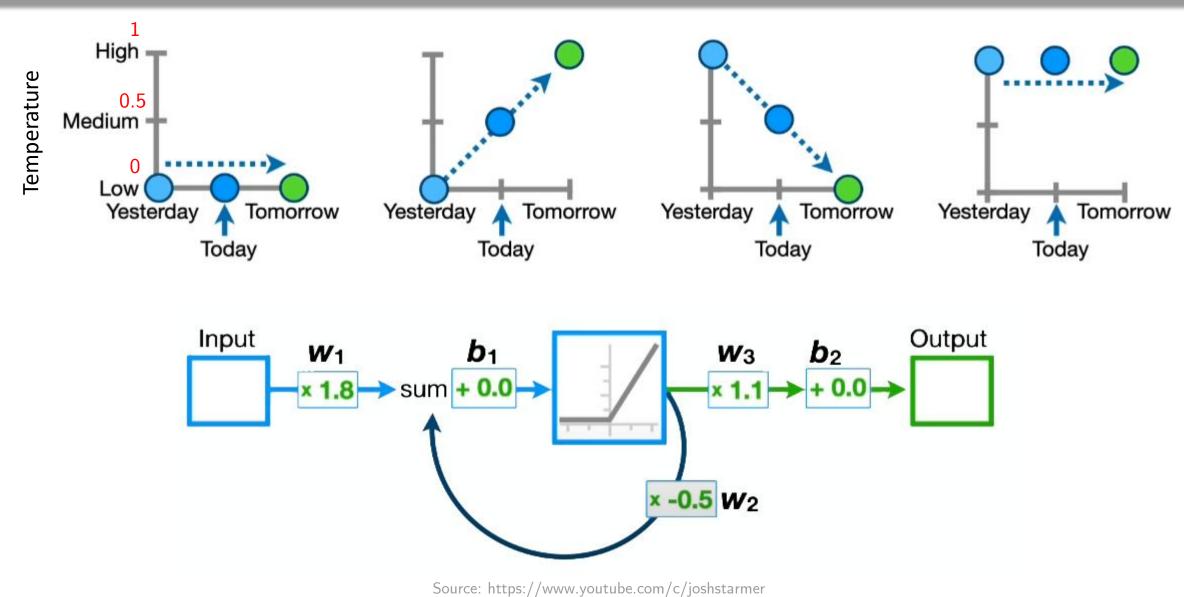

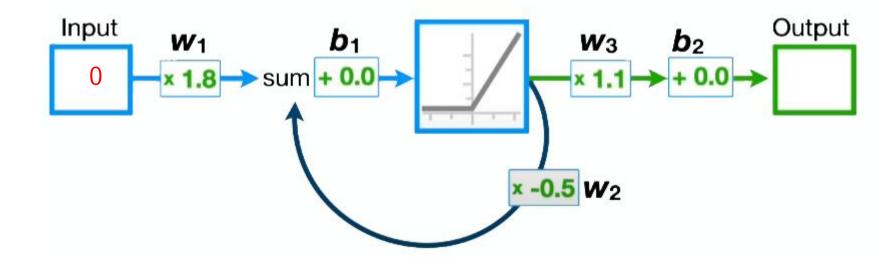

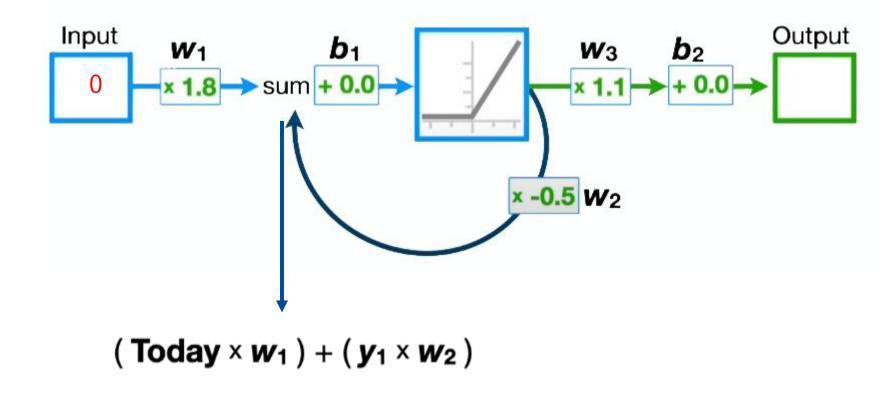

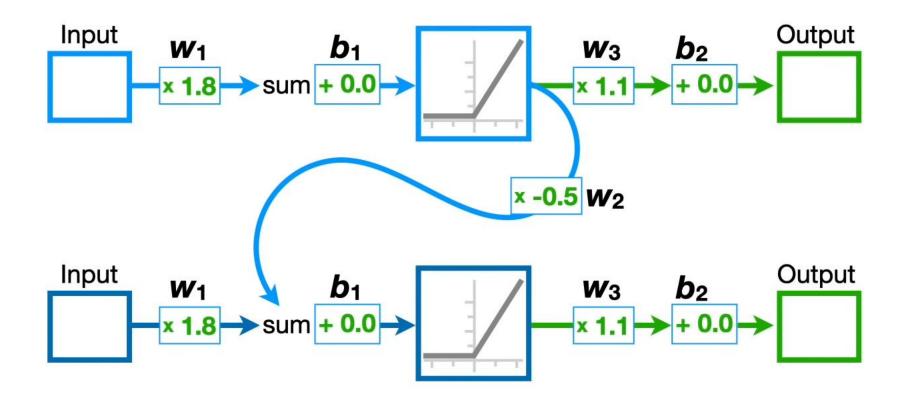

Problem: Given the temperatures of yesterday and today predict tomorrow's temperature.

- At each time step, the loss $L_i(\theta)$ is calculated, where $\theta = \{U, V, W, b, c\}$ is the set of parameters.

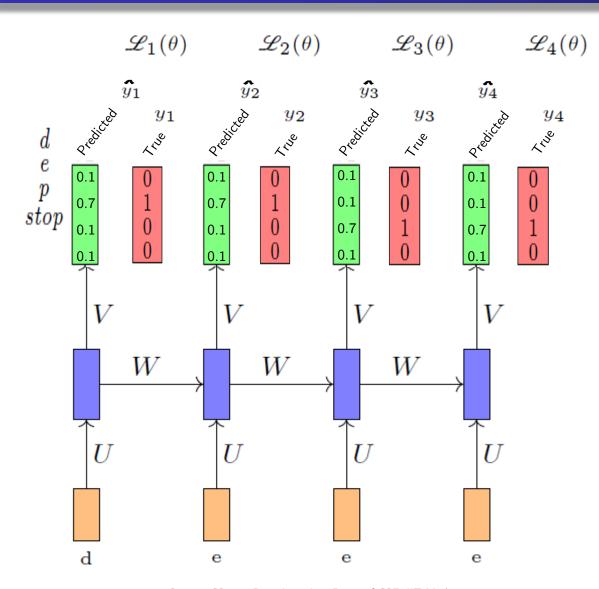

To train the RNNs we need to answer two questions:

To train the RNNs we need to answer two questions:

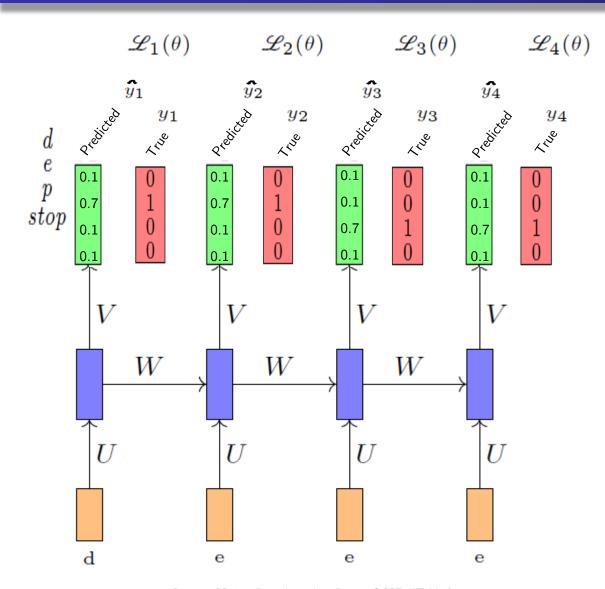

1) What is the total loss made by the model?

To train the RNNs we need to answer two questions:

1) What is the total loss made by the model?

2) How do we backpropagate this loss and update the parameters of the network ?

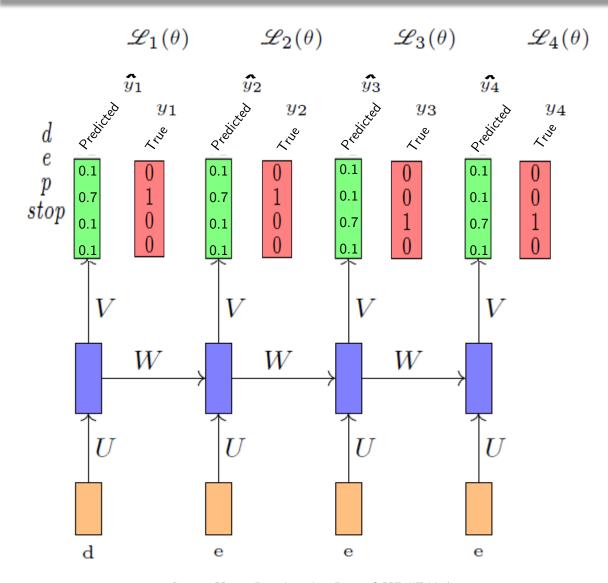

To train the RNNs we need to answer two questions:

1) What is the total loss made by the model?

Ans: the Sum of individual losses

$$\mathscr{L}(\theta) = \sum_{t=1}^{T} \mathscr{L}_t(\theta)$$

2) How do we backpropagate this loss and update the parameters of the network?

To train the RNNs we need to answer two questions:

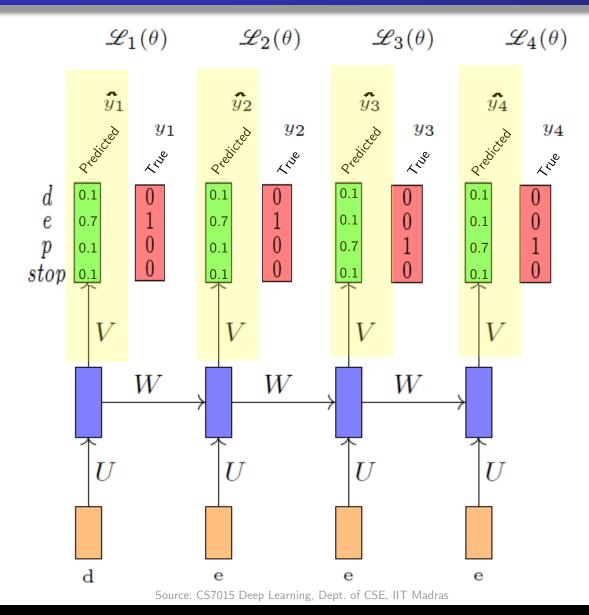

1) What is the total loss made by the model?

Ans: the Sum of individual losses

$$\mathscr{L}(\theta) = \sum_{t=1}^{T} \mathscr{L}_t(\theta)$$

2) How do we backpropagate this loss and update the parameters of the network ?

Ans: BPTT by computing the partial derivative of L w.r.t U, V, W, b, c

Let us consider $\frac{\partial \mathcal{L}(\theta)}{\partial V}$ (V is a matrix so ideally we should write $\nabla_v \mathcal{L}(\theta)$)

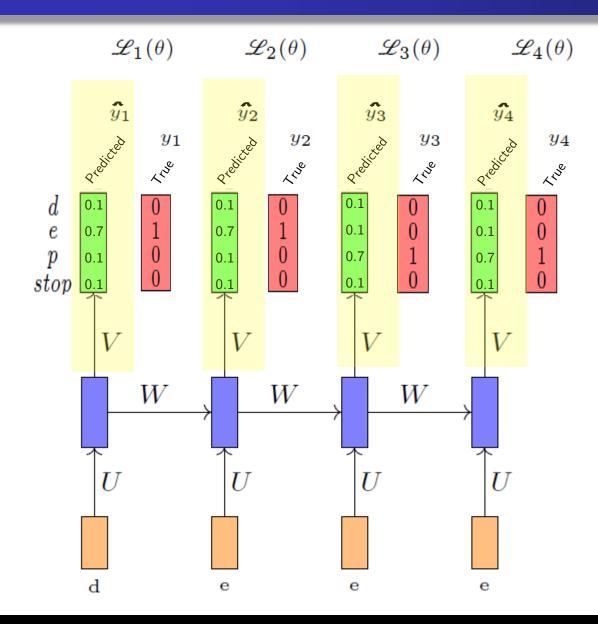

$$\frac{\partial \mathcal{L}(\theta)}{\partial V} = \sum_{t=1}^{T} \frac{\partial \mathcal{L}_t(\theta)}{\partial V}$$

For example, if:

$$\hat{y_4}=O(VS_4+c)$$
 and $L_4=rac{1}{2}(y_4-\hat{y}_4)^2$

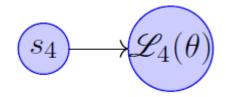

Ignoring bias and considering O as linear:

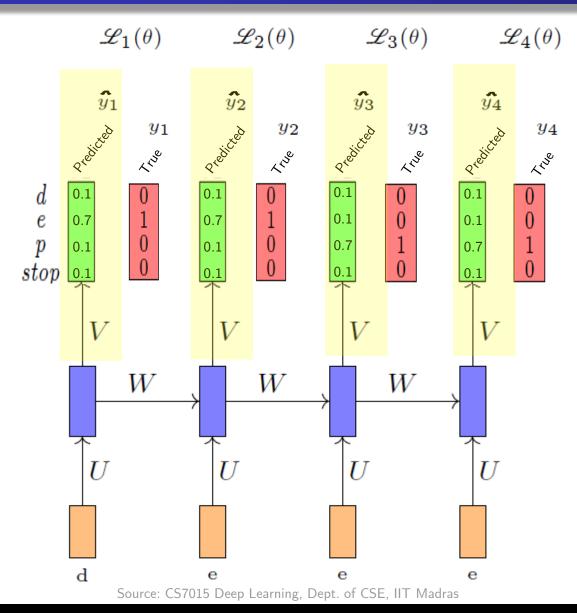

$$rac{\partial L_4}{\partial V} = rac{\partial L_4}{\partial \hat{y_4}} rac{\partial \hat{y_4}}{\partial V}$$
 $rac{\partial L_4}{\partial V} = -(y_4 - \hat{y}_4). s_4$

Let us consider the derivative $\frac{\partial \mathcal{L}(\theta)}{\partial W}$

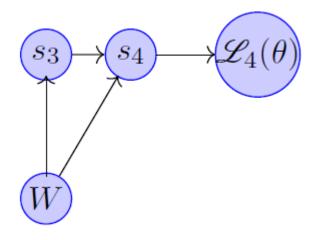

$$\frac{\partial \mathcal{L}(\theta)}{\partial W} = \sum_{t=1}^{T} \frac{\partial \mathcal{L}_t(\theta)}{\partial W}$$

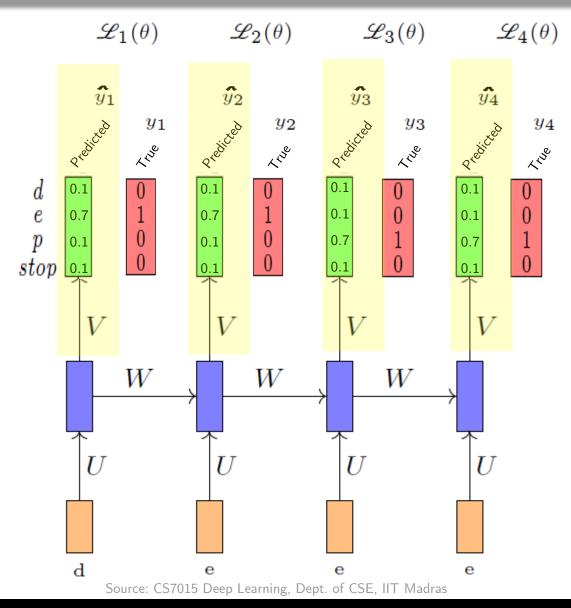

Let us consider the derivative $\frac{\partial \mathcal{L}(\theta)}{\partial W}$

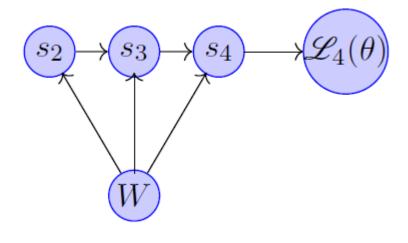

$$\frac{\partial \mathcal{L}(\theta)}{\partial W} = \sum_{t=1}^{T} \frac{\partial \mathcal{L}_t(\theta)}{\partial W}$$

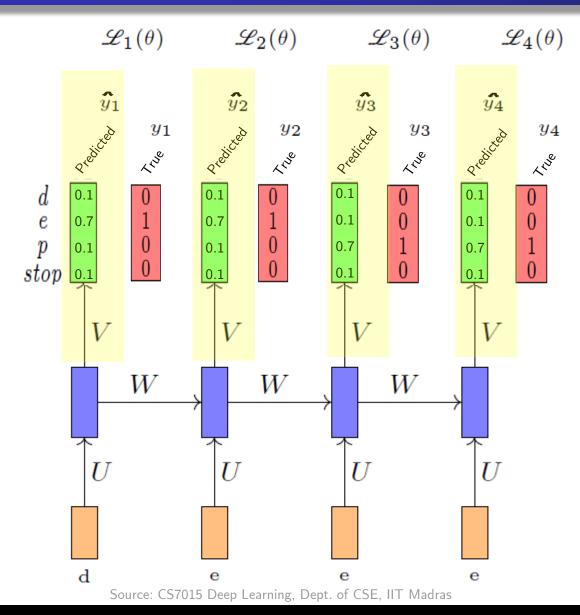

Let us consider the derivative $\frac{\partial \mathcal{L}(\theta)}{\partial W}$

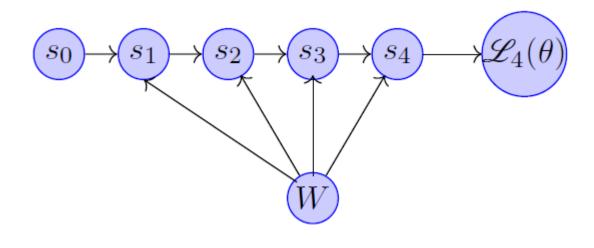

$$\frac{\partial \mathcal{L}(\theta)}{\partial W} = \sum_{t=1}^{T} \frac{\partial \mathcal{L}_t(\theta)}{\partial W}$$

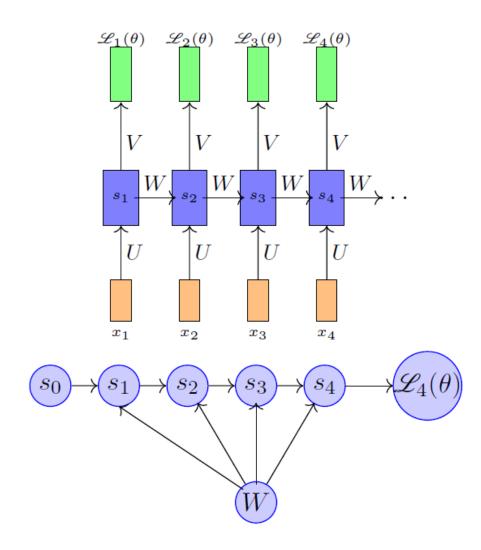

Let us consider the derivative $\frac{\partial \mathcal{L}(\theta)}{\partial W}$

$$\frac{\partial \mathcal{L}(\theta)}{\partial W} = \sum_{t=1}^{T} \frac{\partial \mathcal{L}_t(\theta)}{\partial W}$$

Ordered network

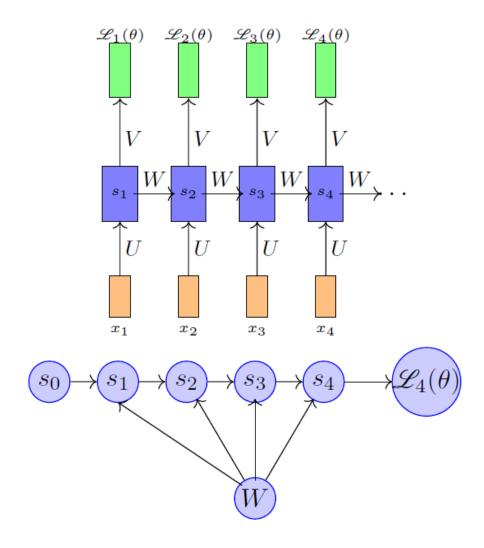

$$\frac{\partial \mathcal{L}_4(\theta)}{\partial W} = \frac{\partial \mathcal{L}_4(\theta)}{\partial s_4} \frac{\partial s_4}{\partial W}$$

 $\frac{\partial \mathscr{L}_4(\theta)}{\partial s_4}$ computation is straight forward

But how do we compute $\frac{\partial s_4}{\partial W}$

$$s_4 = \sigma(Ws_3 + b)$$

In such an ordered network, we can't compute $\frac{\partial s_4}{\partial W}$ by simply treating s_3 as a constant (because it also depends on W)

But how do we compute $\frac{\partial s_4}{\partial W}$

In such networks the total derivative $\frac{\partial s_4}{\partial W}$ has two parts

Explicit: $\frac{\partial^{+}s_{4}}{\partial W}$, treating all other inputs as constant

Implicit: Summing over all indirect paths from s_4 to W

$$\frac{\partial s_4}{\partial W} = \underbrace{\frac{\partial^+ s_4}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_4}{\partial s_3}}_{\text{implicit}} \underbrace{\frac{\partial s_3}{\partial W}}_{\text{implicit}}$$

$$\frac{\partial s_4}{\partial W} = \underbrace{\frac{\partial^+ s_4}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial s_3}{\partial W}}_{\text{implicit}}$$

$$= \underbrace{\frac{\partial^+ s_4}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_4}{\partial s_3} \left[\underbrace{\frac{\partial^+ s_3}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_3}{\partial s_2} \frac{\partial s_2}{\partial W}}_{\text{implicit}} \right]$$

$$= \underbrace{\frac{\partial^+ s_4}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_4}{\partial s_3} \left[\underbrace{\frac{\partial^+ s_3}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_3}{\partial s_2} \frac{\partial s_2}{\partial W}}_{\text{implicit}} \right]$$

$$\frac{\partial s_4}{\partial W} = \underbrace{\frac{\partial^+ s_4}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial s_3}{\partial W}}_{\text{implicit}}$$

$$= \underbrace{\frac{\partial^+ s_4}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_4}{\partial s_3} \left[\underbrace{\frac{\partial^+ s_3}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_3}{\partial s_2} \frac{\partial s_2}{\partial W}}_{\text{implicit}} \right]$$

$$= \underbrace{\frac{\partial^+ s_4}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial^+ s_3}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial s_3}{\partial S_2} \left[\underbrace{\frac{\partial^+ s_2}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_2}{\partial s_1} \frac{\partial s_1}{\partial W}}_{\text{explicit}} \right]$$

$$\frac{\partial s_4}{\partial W} = \underbrace{\frac{\partial^+ s_4}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial s_3}{\partial W}}_{\text{implicit}}$$

$$= \frac{\partial^+ s_4}{\partial W} + \frac{\partial s_4}{\partial s_3} \left[\underbrace{\frac{\partial^+ s_3}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_3}{\partial s_2} \frac{\partial s_2}{\partial W}}_{\text{implicit}} \right]$$

$$= \frac{\partial^+ s_4}{\partial W} + \frac{\partial s_4}{\partial s_3} \underbrace{\frac{\partial^+ s_3}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial s_3}{\partial s_2}}_{\text{implicit}} \left[\underbrace{\frac{\partial^+ s_2}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_2}{\partial s_1} \frac{\partial s_1}{\partial W}}_{\text{explicit}} \right]$$

$$= \frac{\partial^+ s_4}{\partial W} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial^+ s_3}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial s_3}{\partial s_2}}_{\text{explicit}} \underbrace{\frac{\partial^+ s_1}{\partial W}}_{\text{implicit}}$$

$$= \frac{\partial^+ s_4}{\partial W} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial^+ s_3}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial s_3}{\partial s_2}}_{\text{explicit}} \underbrace{\frac{\partial^+ s_1}{\partial W}}_{\text{explicit}}$$

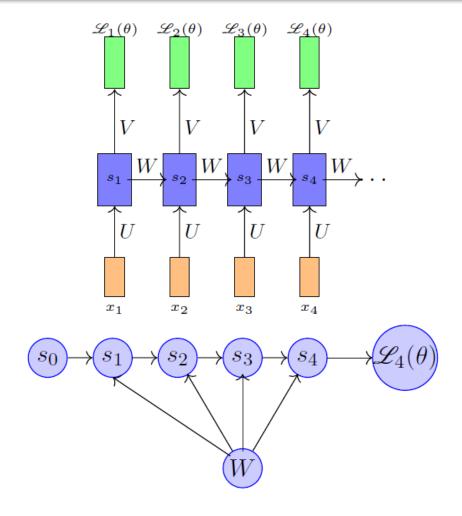

$$= \frac{\partial^+ s_4}{\partial W} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial^+ s_3}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial s_3}{\partial s_2}}_{\text{explicit}} \underbrace{\frac{\partial^+ s_1}{\partial W}}_{\text{explicit}}$$

$$= \frac{\partial^+ s_4}{\partial W} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial^+ s_3}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial s_3}{\partial s_2}}_{\text{explicit}} \underbrace{\frac{\partial^+ s_1}{\partial W}}_{\text{explicit}}$$

$$= \frac{\partial^+ s_4}{\partial W} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial^+ s_3}{\partial W}}_{\text{explicit}} + \underbrace{\frac{\partial s_4}{\partial s_3} \frac{\partial s_3}{\partial S_2}}_{\text{explicit}} \underbrace{\frac{\partial^+ s_1}{\partial W}}_{\text{explicit}}$$

For simplicity we will short-circuit some of the paths

$$\frac{\partial s_4}{\partial W} = \frac{\partial s_4}{\partial s_4} \frac{\partial^+ s_4}{\partial W} + \frac{\partial s_4}{\partial s_3} \frac{\partial^+ s_3}{\partial W} + \frac{\partial s_4}{\partial s_2} \frac{\partial^+ s_2}{\partial W} + \frac{\partial s_4}{\partial s_1} \frac{\partial^+ s_1}{\partial W} = \sum_{k=1}^4 \frac{\partial s_4}{\partial s_k} \frac{\partial^+ s_k}{\partial S_k} = \sum_{k=1}^4 \frac{\partial s_k}{\partial S_k} \frac{\partial^+ s_k}{\partial S_k} = \sum_{k=1}^4 \frac{\partial s_k}{\partial S_k} \frac{\partial s_k}{\partial S_k} = \sum_{k=1}^4 \frac{\partial s_k}{\partial S$$

Finally we have

$$\frac{\partial \mathcal{L}_4(\theta)}{\partial W} = \frac{\partial \mathcal{L}_4(\theta)}{\partial s_4} \frac{\partial s_4}{\partial W}$$
$$\frac{\partial s_4}{\partial W} = \sum_{k=1}^4 \frac{\partial s_4}{\partial s_k} \frac{\partial^+ s_k}{\partial W}$$

$$\therefore \frac{\partial \mathcal{L}_t(\theta)}{\partial W} = \frac{\partial \mathcal{L}_t(\theta)}{\partial s_t} \sum_{k=1}^t \frac{\partial s_t}{\partial s_k} \frac{\partial^+ s_k}{\partial W}$$

This algorithm is called backpropagation through time (BPTT) as we backpropagate over all previous time steps

We will now focus on $\frac{\partial s_t}{\partial s_k}$ and highlight an important problem in training RNN's using BPTT

$$\frac{\partial s_t}{\partial s_k} = \frac{\partial s_t}{\partial s_{t-1}} \frac{\partial s_{t-1}}{\partial s_{t-2}} \dots \frac{\partial s_{k+1}}{\partial s_k} = \prod_{j=k}^{t-1} \frac{\partial s_{j+1}}{\partial s_j}$$

Let us look at one such term in the product (i.e., $\frac{\partial s_{j+1}}{\partial s_i}$)

Recall that:

$$a_j = W s_{j-1} + b$$
$$s_j = \sigma(a_j)$$

Therefore

$$\frac{\partial s_{j+1}}{\partial s_j} = \frac{\partial s_j}{\partial s_{j-1}} = \underbrace{\frac{\partial s_j}{\partial a_j}}_{\partial s_{j-1}} \frac{\partial a_j}{\partial s_{j-1}}$$

$$a_j = [a_{j1}, a_{j2}, a_{j3}, \dots a_{jd},]$$

 $s_j = [\sigma(a_{j1}), \sigma(a_{j2}), \dots \sigma(a_{jd})]$

$$\frac{\partial s_j}{\partial a_j} = \left[\begin{array}{c} \\ \\ \end{array} \right]$$

We will now focus on $\frac{\partial s_t}{\partial s_k}$ and highlight an important problem in training RNN's using BPTT

$$\frac{\partial s_t}{\partial s_k} = \frac{\partial s_t}{\partial s_{t-1}} \frac{\partial s_{t-1}}{\partial s_{t-2}} \dots \frac{\partial s_{k+1}}{\partial s_k}$$

Let us look at one such term in the product (i.e., $\frac{\partial s_{j+1}}{\partial s_j}$)

$$a_j = W s_{j-1} + b$$
$$s_j = \sigma(a_j)$$

$$\frac{\partial s_j}{\partial s_{j-1}} = \frac{\partial s_j}{\partial a_j} \frac{\partial a_j}{\partial s_{j-1}}$$

$$a_j = [a_{j1}, a_{j2}, a_{j3}, \dots a_{jd},]$$

 $s_j = [\sigma(a_{j1}), \sigma(a_{j2}), \dots \sigma(a_{jd})]$

$$\frac{\partial s_j}{\partial a_j} = \begin{bmatrix}
\frac{\partial s_{j1}}{\partial a_{j1}} & \frac{\partial s_{j2}}{\partial a_{j1}} & \frac{\partial s_{j3}}{\partial a_{j1}} & \dots \\
\frac{\partial s_{j1}}{\partial a_{j2}} & \frac{\partial s_{j2}}{\partial a_{j2}} & \ddots \\
\vdots & \vdots & \vdots & \frac{\partial s_{jd}}{\partial a_{jd}}
\end{bmatrix}$$

$$= \begin{bmatrix} \sigma'(a_{j1}) & 0 & 0 & 0 \\ 0 & \sigma'(a_{j2}) & 0 & 0 \\ 0 & 0 & \ddots & \\ 0 & 0 & \dots & \sigma'(a_{jd}) \end{bmatrix}$$

We will now focus on $\frac{\partial s_t}{\partial s_k}$ and highlight an important problem in training RNN's using BPTT

$$\frac{\partial s_t}{\partial s_k} = \frac{\partial s_t}{\partial s_{t-1}} \frac{\partial s_{t-1}}{\partial s_{t-2}} \dots \frac{\partial s_{k+1}}{\partial s_k}$$

Let us look at one such term in the product (i.e., $\frac{\partial s_{j+1}}{\partial s_j}$)

$$a_j = W s_{j-1} + b$$
$$s_j = \sigma(a_j)$$

$$\frac{\partial s_j}{\partial s_{j-1}} = \frac{\partial s_j}{\partial a_j} \frac{\partial a_j}{\partial s_{j-1}}$$

$$a_j = [a_{j1}, a_{j2}, a_{j3}, \dots a_{jd},]$$

 $s_j = [\sigma(a_{j1}), \sigma(a_{j2}), \dots \sigma(a_{jd})]$

$$\frac{\partial s_j}{\partial a_j} = \begin{bmatrix}
\frac{\partial s_{j1}}{\partial a_{j1}} & \frac{\partial s_{j2}}{\partial a_{j1}} & \frac{\partial s_{j3}}{\partial a_{j1}} & \dots \\
\frac{\partial s_{j1}}{\partial a_{j2}} & \frac{\partial s_{j2}}{\partial a_{j2}} & \ddots \\
\vdots & \vdots & \vdots & \frac{\partial s_{jd}}{\partial a_{jd}}
\end{bmatrix}$$

$$= \begin{bmatrix} \sigma'(a_{j1}) & 0 & 0 & 0 \\ 0 & \sigma'(a_{j2}) & 0 & 0 \\ 0 & 0 & \ddots & \\ 0 & 0 & \dots & \sigma'(a_{jd}) \end{bmatrix}$$

$$= diag(\sigma^{'}(a_{j}))$$

We will now focus on $\frac{\partial s_t}{\partial s_k}$ and highlight an important problem in training RNN's using BPTT

$$\frac{\partial s_t}{\partial s_k} = \frac{\partial s_t}{\partial s_{t-1}} \frac{\partial s_{t-1}}{\partial s_{t-2}} \dots \frac{\partial s_{k+1}}{\partial s_k}$$

Let us look at one such term in the product (i.e., $\frac{\partial s_{j+1}}{\partial s_i}$)

$$a_j = W s_{j-1} + b$$
$$s_j = \sigma(a_j)$$

$$\frac{\partial s_j}{\partial s_{j-1}} = \frac{\partial s_j}{\partial a_j} \frac{\partial a_j}{\partial s_{j-1}}$$

We are interested in the magnitude

$$a_j = [a_{j1}, a_{j2}, a_{j3}, \dots a_{jd},]$$

 $s_j = [\sigma(a_{j1}), \sigma(a_{j2}), \dots \sigma(a_{jd})]$

$$\frac{\partial s_j}{\partial a_j} = \begin{bmatrix} \frac{\partial s_{j1}}{\partial a_{j1}} & \frac{\partial s_{j2}}{\partial a_{j1}} & \frac{\partial s_{j3}}{\partial a_{j1}} & \dots \\ \frac{\partial s_{j1}}{\partial a_{j2}} & \frac{\partial s_{j2}}{\partial a_{j2}} & \ddots \\ \vdots & \vdots & \vdots & \frac{\partial s_{jd}}{\partial a_{jd}} \end{bmatrix}$$

We are interested in the magnitude of
$$\frac{\partial s_j}{\partial s_{j-1}} \leftarrow$$
 if it is small (large) $\frac{\partial s_t}{\partial s_k}$ and hence $\frac{\partial \mathcal{L}_t}{\partial W}$ will vanish (explode)
$$\frac{\partial s_j}{\partial s_j} = \frac{\partial s_j}{\partial s_j} \frac{\partial a_j}{\partial s_j}$$

$$\frac{\partial s_j}{\partial s_j} = \frac{\partial s_j}{\partial s_j} \frac{\partial a_j}{\partial s_j}$$
We are interested in the magnitude of $\frac{\partial s_t}{\partial s_k}$ and hence $\frac{\partial \mathcal{L}_t}{\partial W}$ will vanish (explode)
$$\frac{\partial s_j}{\partial s_j} = \frac{\partial s_j}{\partial s_j} \frac{\partial a_j}{\partial s_j}$$

$$\frac{\partial s_j}{\partial s_j} = \frac{\partial s_j}{\partial s_j} \frac{\partial a_j}{\partial s_j}$$

$$= diag(\sigma^{'}(a_j))$$

$$\left\| \frac{\partial s_j}{\partial s_{j-1}} \right\| = \left\| \operatorname{diag}(\sigma'(a_j))W \right\|$$

$$\leq \left\| \operatorname{diag}(\sigma'(a_j)) \right\| \|W\|$$

 $\sigma(a_j)$ is a bounded function (sigmoid, tanh) $\sigma'(a_j)$ is bounded

$$\sigma'(a_j) \le \frac{1}{4} = \gamma [\text{if } \sigma \text{ is logistic }]$$

 $\le 1 = \gamma [\text{if } \sigma \text{ is tanh }]$

$$\left\| \frac{\partial s_j}{\partial s_{j-1}} \right\| \le \gamma \|W\|$$

$$\le \gamma \lambda$$

$$\left\| \frac{\partial s_t}{\partial s_k} \right\| = \left\| \prod_{j=k+1}^t \frac{\partial s_j}{\partial s_{j-1}} \right\|$$

$$\leq \prod_{j=k+1}^t \gamma \lambda$$

$$\leq (\gamma \lambda)^{t-k}$$

If $\gamma \lambda < 1$ the gradient will vanish If $\gamma \lambda > 1$ the gradient could explode

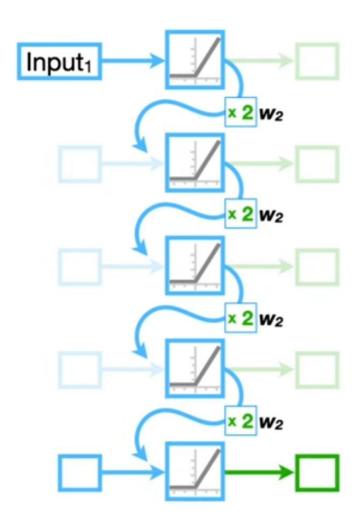

And that means the first input value is amplified

16 times before it gets to the final copy of the network.

$$Input_1 \times 2 \times 2 \times 2 \times 2$$

 $= Input_1 \times 2^4$

= Input₁ × w₂Num. Unroll

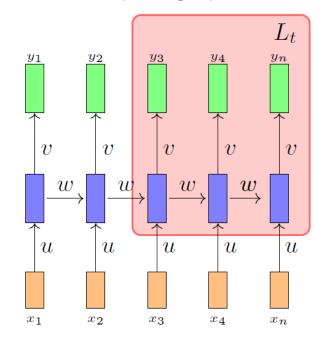

Back Propagation through time in RNNs: Issues & Solutions

- 1. Gradient calculations are expensive (slow training for long sequences)
 - Solution: Truncated BPTT

2. Exploding gradients

3. Vanishing gradients

Source: CS7015 Deep Learning, Dept. of CSE, IIT Madras

Instead of looking at all 'n' time steps, we would look at lesser time steps allowing us to estimate rather than calculate the gradient used to update the weights.

Back Propagation through time in RNNs: Issues & Solutions

- 1. Gradient calculations are expensive (slow training for long sequences)
 - Solution: Truncated BPTT

- 2. Exploding gradients
 - Solution: Gradient Clipping

3. Vanishing gradients

Let
$$g = \frac{\partial L}{\partial W}$$

I. Clipping by value:

if $\|\mathbf{g}\| \ge \max_{\mathbf{threshold}}$ then:

 $g \leftarrow threshold$

end if

II. Clipping by norm:

if $\|\mathbf{g}\| \ge$ threshold then:

 $g \leftarrow \text{threshold } * g/\|g\|$

end if

Back Propagation through time in RNNs: Issues & Solutions

- 1. Gradient calculations are expensive (slow training for long sequences)
 - Solution: Truncated BPTT

- 2. Exploding gradients
 - Solution: Gradient Clipping

- 3. Vanishing gradients
 - Solution: Use alternate RNN architectures such as LSTM and GRU.
